

A few atmospheric rivers (AR) are expected to make landfall in the 6-day forecast, estimating near 9 inches in the North and about 1-3 inches in the South and Central portions of the state. The first is expected Tuesday evening, with a stronger and longer AR forecasted for Thursday. Potential third forecasted between Oct. 23 and 25. Combined totals from these storm events may be enough for significant streamflow increases.

Project Operations

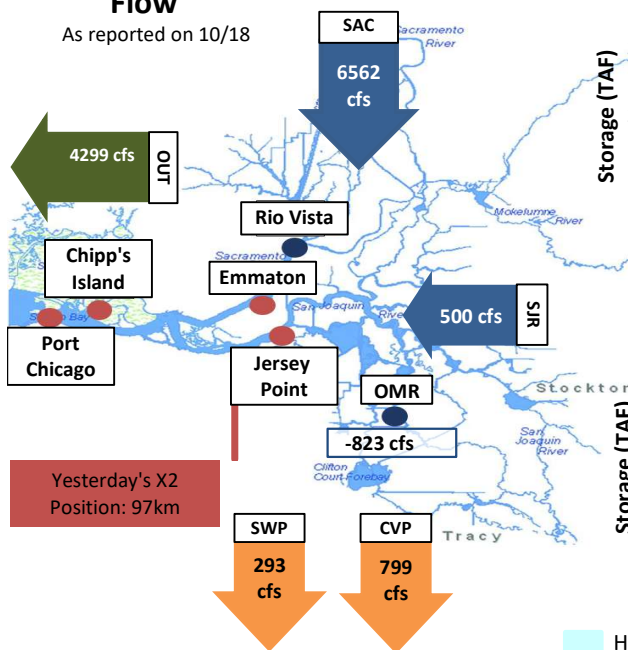

10/19/2021

Delta outflow conditions continue to be balanced with salinity management controlling operations. Installation of the False River flow barrier allows slightly lower outflows that save upstream reservoir storage. Delta inflows remain low, with inflows as needed for outflow, in-Delta use and exports. Upstream storage at Shasta, Folsom and Oroville is falling, with Oroville falling below its 1977 historical low storage level. Reservoir releases have been at rates just high enough to meet upstream demands and outflow requirements.
