

California Statewide Hydroclimate

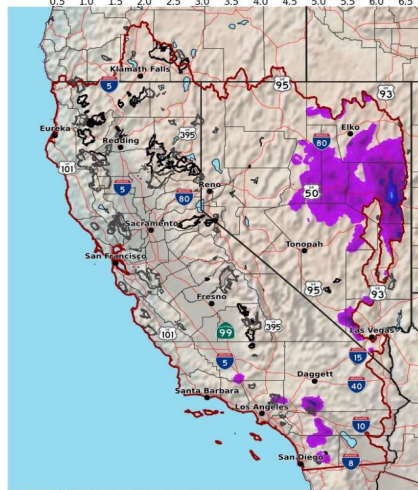

1/21/2022

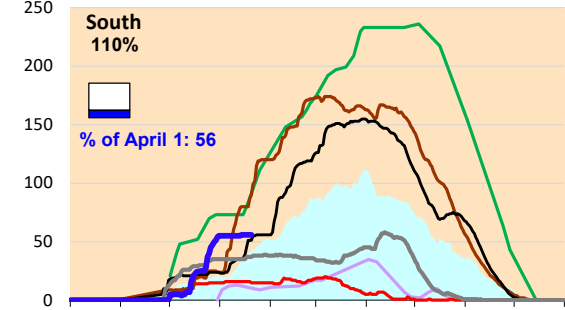

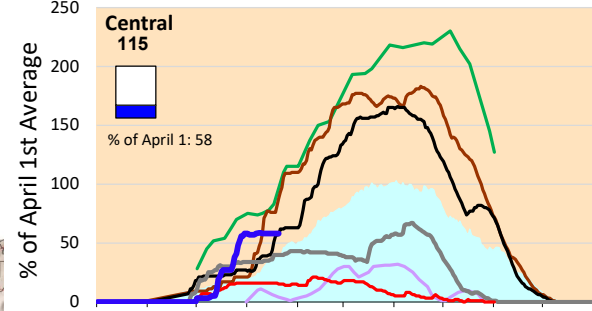

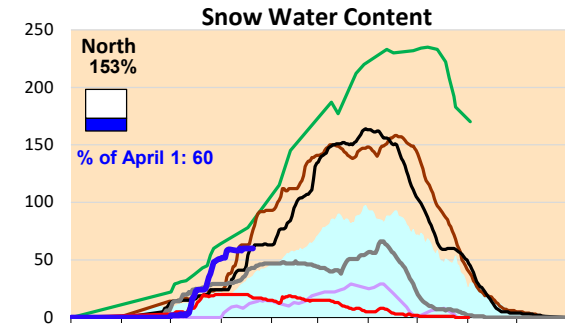

Short precipitation forecast over small patches of Southern California and Nevada region for the weekend. The cumulative precipitation and snow water content remain steady but are substantially above normal for this time of year.

*Note: Percentages in each plot refers to percent of average for this date. When historic data is unavailable, Snow Water Content Bar plot is not shown. The percent of historic average for each SWC location differs slightly from CDEC's report due to small discrepancies in historical data.

Project Operations

1/21/2022

Delta outflow conditions continue to be 'excess with restrictions' with Old and Middle River flows restricting exports. Delta inflows and outflow reduced, with Delta exports for SWP and CVP holding steady since last week. Storage at Shasta and Oroville increased but still running below average level for this time of year. Storage at Folsom is higher than the historic average level and now at Flood reservation space with higher releases.

Note: Yesterday's X-2 Position is estimated.
