

Strong storms are forecasted to continue for California though next week. Cumulative precipitation for the Sierras are similar to average value for this time of year. The snow water content is above the average values for this time of year. Actual runoff is similar to the historical average rates.

*Note: Percentages in each plot refers to percent of average for this date. When historic data is unavailable, Snow Water Content Bar plot is not shown. The percent of historic average for each SWC location differs slightly from CDEC's report due to small discrepancies in historical data.

Project Operations

1/6/2023

Delta outflow conditions continue to remain 'excess Delta conditions with restrictions'. Delta outflows, and SAC and SJR inflows have increased as compared to last week. SWP export is higher, while CVP export is lower than last week's amounts. Low salinity conditions in the South Delta are allowing increased SWP and CVP exports. Shasta and Oroville Reservoir storage amounts are significantly below average levels for this time of year. The storage at Folsom is at the historic average level and releases have been increased to maintain flood storage requirements. All storage volumes increased from last week.
