

Small amounts of precipitation are forecasted for Central and Northern California through this weekend. Cumulative precipitation for the Sierras are above average value for this time of year. The snow water content is above the average values for this time of year. For the Central and South areas, snow water content is above wet year (1983) for this time of year. Actual runoff is higher than the historical average rates, close to conditions experienced in 1983.

*Note: Percentages in each plot refers to percent of average for this date. When historic data is unavailable, Snow Water Content Bar plot is not shown. The percent of historic average for each SWC location differs

6-Day Forecast Precipitation (inches)

Delta outflow conditions changed to 'excess Delta conditions with restrictions'. Delta outflows and SAC and SJR inflows have decreased as compared to last week. CVP export has increased and SWP export is lower than the last week's amounts. Salinity conditions the Delta remain at very low levels, allowing high exports. Shasta reservoir storage amounts remains below average levels for this time of year. The storage at Folsom and Oroville are at the historic average level. All storage volumes increased from last week.
